

CONTINUOUS ACTIVE LEARNING

Redefining eDiscovery

EASY TO SETUP PROFILES

On the Venio Platform, a profile is created for each reviewer and then they are ready to begin reviewing documents.

REVIEW & TRAIN IN PARALLEL

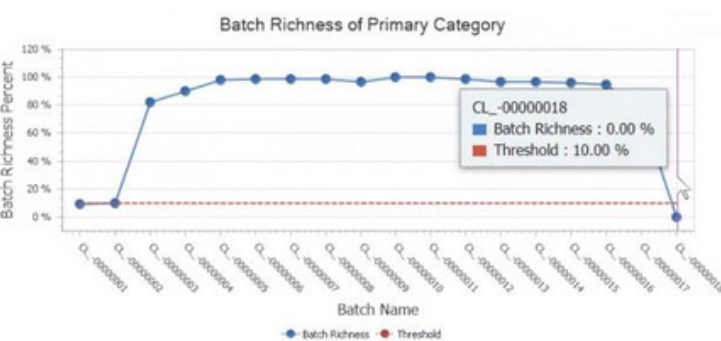

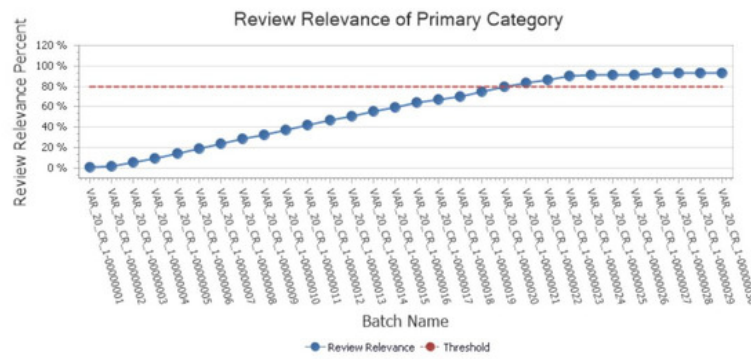

Once a Reviewer begins reviewing documents, it is training the model in parallel. The model is actively learning during the creation of the control set and the seed set by identifying and tagging the most relevant documents.

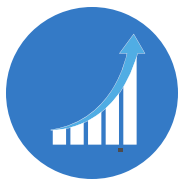

CONTINUOUS ACTIVE LEARNING

CAL continues to learn during each batch and updates the model as each batch is checked back into the platform. The result is an exponential learning curve when it comes to document relevance.

RICHNESS OF YOUR RESULTS

Set your confidence levels for the batches your team review. CAL will identify when the richness declines which means the necessary documents have been found.

SAVE TIME & MONEY

In this example, only 1,805 documents were reviewed out of 19,524, roughly 10%, before the confidence thresholds were met.
